EDUCATION

Northeastern University, Khoury College of Computer Sciences
B.S. in Computer Science, Concentration in Artificial Intelligence | **GPA: 3.7/4.0** | Dean's List — May 2027
Coursework: Engineering LLM-Integrated Systems, Machine Learning, Algorithms & Data, Computer Systems

EXPERIENCE

Biogen — Cambridge, MA
AI Engineer, Co-op — January 2026 - June 2026

- Designed and built the core of a persistent enterprise AI agent (Claude SDK, Azure, Databricks) that automates workflows from Microsoft Teams, **used by all of Biogen's citizen developers**
- Led a cross-functional redesign of Biogen's AI intake platform, collaborating with requesters from every business unit to merge fragmented workflows into one reviewed queue and clear a 200+ request backlog
- **Cut decision turnaround from months to about a week**, automating 4 recurring business workflows across Azure AI Services, Databricks, Snowflake and Power Automate

Gyu-Kaku — Boston, MA
Server — May 2023 - January 2026

- Promoted to train new servers; ran 7-8 tables at once at peak, 20-30 hrs/week alongside full-time study

PUBLICATIONS

Huynh, T. "Playing for First from Ten Times Behind: Rank-Maximising Strategy and Play-Money Price Compression in a 2026 Midterms Prediction-Market Tournament." *SSRN Working Paper* [Paper] — November 2026

- Kalshi priced the eventual winner at 0.97 before the AP call in all 31 contested races, **a median 108 minutes early**

PROJECTS

CruxPack [Live | Demo] | *TypeScript, Next.js, SQLite/Drizzle, Fly.io, Gemini, Stripe* — June 2026 - August 2026

- Built cruxpack.io, an AI study platform that turns lecture PDFs into study material cited to source pages
- Ran an LLM-as-judge evaluation of 770 generated claims: **98.7% accurate**, 8 of the 10 errors hallucinations; added deterministic grounding checks that caught all 5 wrong chemical structures with no false alarms
- Built a figure pipeline (locate, classify, then disambiguate) that binds each extracted diagram to the fact it illustrates, with unsafe-content screening run on the app's own server before any model call

Predictions Cup Trading System [Paper] | *Python, asyncio, WebSockets, NumPy* — October 2026 - November 2026

- Designed a trading system for Susquehanna's play-money midterms contest and led AI coding agents to build it: real-time feeds from 3 venues, **sub-millisecond in-process p95 signal-to-order latency**, risk caps, monitoring, kill switch
- Optimized the strategy by Monte Carlo simulation for the probability of finishing first, not expected profit; verified the system end to end with live orders on the Cup's exchange

GitTimeline [Demo | GitHub] | *TypeScript, Preact, Canvas2D, Web Workers, Playwright* — September 2026

- Pre-built repository histories so no GitHub token reaches the browser; visitors replay all 1.48M commits of Linux's history with zero GitHub API calls, enforced by a test
- **Cut p95 frame time from 50 ms to 33 ms**, one full vsync: profiled the renderer, traced 20.9 ms per frame to one Canvas filter call and replaced it with a mip-chain bloom

TECHNICAL SKILLS

Programming Languages: Python, TypeScript, JavaScript, Java, C, C++, Rust, SQL, HTML, CSS
AI/ML: LLMs, AI agents, LLM evaluation, prompt engineering, Claude SDK, PyTorch, scikit-learn, NumPy, Pandas
Frameworks & Backend: FastAPI, Next.js, React, Preact, Node.js, Express.js, Flask, Vite, REST APIs
Data: Databricks, Snowflake, PostgreSQL, SQLite/Drizzle, Redis, MongoDB
Cloud, DevOps & Testing: Azure, AWS, Vercel, Fly.io, Docker, GitHub Actions, Git, Linux, Playwright, Vitest

ACTIVITIES & AWARDS

Competitive Programming: **4th place in the state**, 32nd of 150 nationally
Gia Dinh Phat Tu, *Team Leader for 6 years*: led weekly youth lessons, trained junior leaders (member 2013 - 2024)
Sundai Club, *Member*: MIT/Harvard AI hacker group that builds and deploys an AI app in a day
